

# Melbourne's Water Outlook 2020

Melbourne's water storages are secure, though real and growing challenges to our water supply availability requires us all to act.

Current system storage level at 27 November 2019

(storage level is inclusive of water provided from the desalination order to date)

# 63.9%

This year's desalination order is

**125 billion litres**

## At a glance:

- We live in a climate that is getting drier and warmer, and our population continues to grow.
- We will increasingly use desalinated water as part of our regular water supply.
- Permanent water use rules remain in place to reduce demand on our precious drinking water.
- We're all encouraged to limit our water consumption to 155 litres per person per day. If we each use seven litres less every day (two thirds of a bucket of water), we can reach Target 155.

## Did you know?

Showering makes up 31% of the water we use at home. Help make every drop count by taking a shorter shower.
