## 1 Introduction

This report documents the autumn 2013 monitoring of translocated Matted Flax-lily (*Dianella amoena*) plants from a plant-out site located to the south of Gibbs Road, Yarra Glen. These plants had been salvaged (then planted in 2010) from parent material occurring within the approved Construction Area of the Sugarloaf pipeline easement (refer to Draft Matted Flax Lily - Translocation Commitment Document, SPA-REP-GL-ENV-Rev A).

Matted Flax-lily plants were also monitored at Hunts Lane (south), Melba Highway, Steels Creek, where they were replanted after being ‘salvaged’ in error; and Hybrid Flax-lily (*Dianella amoena* x *D. admixta*) plants were monitored at Hunts Lane (north) (Melba Highway) which were also ‘salvaged’ in error and then replanted.

This monitoring assessment was the fourth undertaken by Ecology Australia for this project; preceding monitoring assessments were undertaken in:

- May 2010 (Carr and Kershaw 2010);
- January 2011 (Carr and Rodda 2011); and
- May 2012 (Carr and Appleby 2012).

### 1.1 Study area

The translocated Matted Flax-lily receptor site is located just to the south of Gibbs Road, Yarra Glen, within the Sugarloaf Pipeline Alliance easement, and measures c. 120 m x 3.0 m (Figure 1). It is fenced with a conventional farm fence. The southern boundary abuts private land with a narrow plantation of fairly small trees which include Silky Oak (*Grevillea robusta*), Oak (*Quercus* sp.), Yellow Gum (*Eucalyptus leucoxylon*) and Red Gum (*E. camaldulensis*).

The two sites containing erroneously salvaged (and replanted) Flax-lily plants are located a short distance north and south of the intersection of Hunts Lane and Melba Highway, Steels Creek (Figure 2). The northern site contains Hybrid Flax-lily (*Dianella amoena* x *D. admixta*), while the southern site contains Matted Flax-lily (*D. amoena*).

## 2 Methods

Details about the propagation of the *D. amoena* plants, and about the planting-out procedures are given in the 2012 monitoring report by Ecology Australia (Carr and Appleby 2012).

### 2.1 Monitoring

As per monitoring prescriptions established for previous monitoring events by Ecology Australia (Carr and Kershaw 2010, Carr and Rodda 2011, Carr and Appleby 2011), the following data were collected for all *Dianella* plants within the Gibbs Road and Hunts Lane monitoring plots:

- **Locations/ coordinates** – collected for individual plants using a Real Time Kinematic Global Positioning System (datum MGA94);
- **Basal diameter** (centimetres) of plant – measured at soil level to the outside of the outermost shoots;
- **Number of shoots** - counted as accurately as possible within a single plant, without unduly disturbing the plant
- **Maximum leaf length** (cm) – measured from the soil level to leaf apex;
- **Number of leaves per shoot** – the range of number of leaves per shoot were recorded (e.g. 2 – 6 leaves on shoot A; 3- 9 leaves on shoot B);
- **Height of inflorescence/ infructescence** – for fertile shoots; this was measured in (cm) from the soil level up to the top of the peduncle;
- **Presence of flower buds** – recorded as a simple presence/ absence designation;
- **Stage of flowering** – assessed subjectively as: early, mid, or late
- **Stage of fruiting** – assessed subjectively as: early, mid, or late.

### 2.2 Representative quadrats (subplots)

Documenting of all of the 1172 *D. amoena* plants translocated to the receptor site was undertaken for the first round of monitoring in May 2010 (Kershaw and Carr 2010). Since then monitoring has only been conducted for a subset of plants, the data from which would be representative of the survival and performance of the full translocated population. The subset of the plant population occur within four permanently subplots evenly distributed along the receptor site (Figure 1, 2a-2d) and each measuring 2 x 2.7 m (i.e. the full width of the receptor site). In each of the permanent plots, all *D. amoena* plants (27, 26, 17 and 34 plants respectively in plots 1 – 4 at the first monitoring) which represent 8.8% of the total population, were documented.

Data from these subplots are given in Appendix 3. The plant number and location of planted *D. amoena* in each subplot is shown in Figures 2a-2d. The data presented in this report were collected according to the above protocols for the four subplots; the data were collected on 28 February and 1 March 2013. Additionally, all plant species recorded in the plant-out site were documented and assigned a cover value from the Braun-Blanquet cover/abundance scale (Gullan 1978, see below).

This is in fact a large quadrat and the data on plants other than *D. amoena* were collected to indicate weeds of management concern and indigenous species colonising the site.

Braun-Blanquet cover/abundance scale:

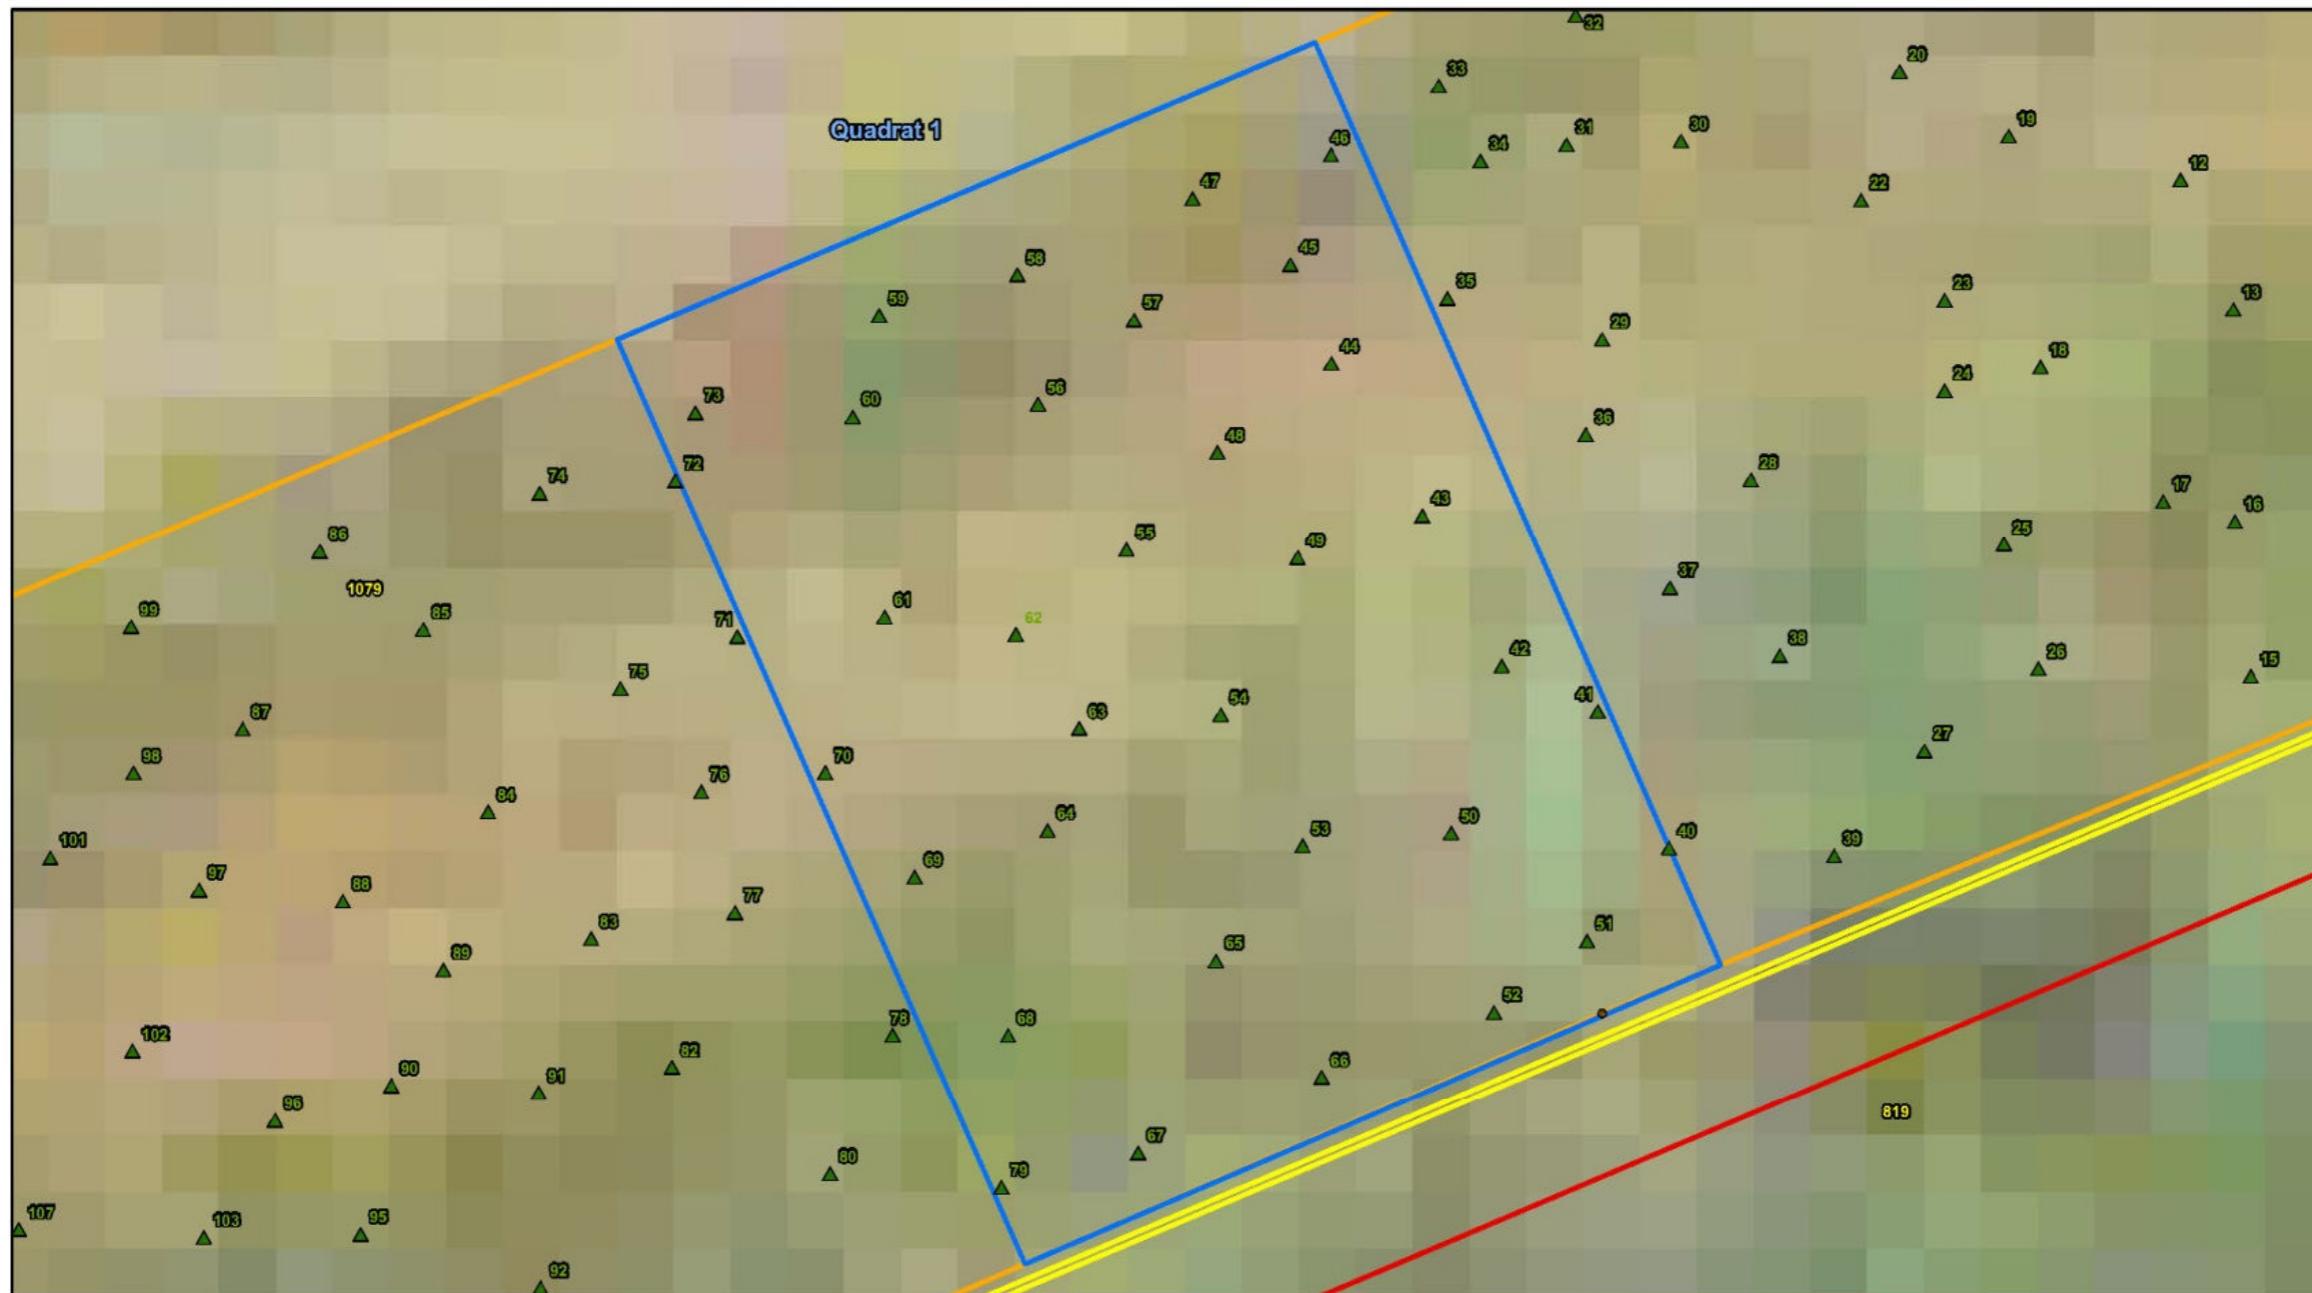

- + cover < 5%, few individuals
- 1 cover < 5%, any number of individuals
- 2 cover 5-20%, any number of individuals
- 3 cover 20-50%, any number of individuals
- 4 cover 50-75%, any number of individuals
- 5 cover 75-100%, any number of individuals

## 2.3 Plant names

Names for indigenous and exotic plant species in this report follow *A Census of the Vascular Plants of Victoria* by Walsh and Stajsic (2007). An asterisk \* denotes exotic species.

### 3 Results

The data collected for each *Dianella* plant in the four quadrats or subplots are given in Appendix 2. Appendix 1 gives the data collected for all plants in 2010. Plates 1 to 6 illustrate the site. The results of the monitoring indicate that there has been good (acceptable) survival of plants on the site – 100 plants were detected and documented. Of the four quadrats one plant was ‘missing’ in Quadrat 1, three were not detected in Quadrat 3, and one was dead in Quadrat 4. This represents an evident 5% mortality which in our opinion is minor.

The performance of plants, that is growth and flowering, has also been good. The measure of performance is indicated by the number of shoots in each plant and whether or not flowering/fruiting has occurred. On each of the plots the separate shoots per plant averaged 5.5, 4.9, 2.9 and 2.6 respectively for plots 1 – 4; individual plants had from 1 – 12 shoots. Plants with few shoots are not performing ideally and the performance is likely to be a function of competition with weeds or with the trees in the plantation on the south side of the plant-out site.

In terms of flowering or fruiting 35% of plants were without inflorescences or infructescences and this is judged to be an acceptable rate of flowering/fruiting.

Overall, the last six months or so with heavy rain events have provided exceptional conditions for growth and flowering and fruiting of *D. amoena*. Flowering has extended well beyond the usual October – January flowering period, at least well into March. The number of fruits produced (Appendix 2) also indicates that natural pollination has been occurring, thus bee pollinators are present because the species is not self-pollinating (although self-fertile; G. Carr unpubl. data).

An inventory of the plant species other than *Dianella* on the site is given in Table 1. Excluding *Dianella amoena*, a total of 110 plant species has been recorded within the receptor site, consisting of 57 native flora taxa with the remaining 53 consisting of weed species. Native flora species recorded were assumed to have recruited from soil-stored seed and also from wind dispersal. Contamination of nursery soil accounted for at least two weed species (\**Euphorbia peplus* and \**Cardamine* sp.). The former has become very abundant.

Additional weed species were recorded on the site and some of these present a major issue for control. Brown-top Bent (\**Agrostis capillaris*) is perhaps the most significant invader. It forms dense swards that will seriously impede *Dianella* survival and performance.

While the suite of exotic species is large, and all exotic species are undesirable, management of many of these is not practicable; other weed species however constitute a major threat to the planted *Dianella* and the indigenous flora recruiting unassisted on the site. About half of the exotic species in Table 1, as well as a few indigenous species are identified as warranting control or elimination from the site. These and other weed species will be subject to ongoing management by contractors as outlined in the Melbourne Water Weed Management Plan (Melbourne Water n.d.).

Provision for periodical weed control and monitoring are detailed in the Matted Flax-lily Translocation Commitment Document (SPA-REP-GL-ENV-001-Rev D-Version 01) and the Melbourne Water Weed Management Plan.

Weed work, utilising several different treatments was carried out on the easement subsequent to the monitoring of *D. amoena* plants given in this report. Plates 1 – 5 give some indication of the differing weed treatments.

#### **In situ sub-populations of *Dianella amoena***

The in situ sub-populations in the Gulf Road road reserve were intended for monitoring. The site was inspected on 2 February 2011 and in February 2013 but no evidence of *Dianella* was seen, we believe for several reasons: most of the site had been slashed and of that remaining unmown, most was covered by a dense growth of exotic grass (predominantly Cocksfoot (\**Dactylis glomerata*)). Growing conditions this year have been extraordinarily favourable for weed growth particularly on the fertile soils locally. *Dianella amoena* could easily fall extinct on these highly vulnerable road-reserve populations.

**Table 1 Plant species recorded in the Matted Flax-lily (*Dianella amoena*) receptor site, Sugarloaf Pipeline Alliance easement, Yarra Glen, 11 January 2011, 13 January 2012 and 13 July and 15 August 2013**

**Plate 6      Hunts Lane (north) plant-out site in road reserve showing high cover of weeds and few *Dianella amoena* x *D. admixta* plants (19 July 2013)**

**Plate 7 Hunts Lane (south) plant-out site in road reserve showing high cover of weeds and few *Dianella amoena* plants (17 July 2013)**

**Plate 8 *Dianella amoena* plant with high cover of exotic grass, principally *Anthoxanthum odoratum* (Sweet Vernal grass) (17 July 2013)**

## 4 Discussion

The data and observations from the 2012 and the 2013 monitoring of *D. amoena* on the pipeline easement show that the performance of plants is highly variable in response to climatic variables (rainfall amount and seasonal distribution) and to competitive interactions with weeds.

Growth occurs predominantly in spring and autumn but can occur throughout summer if sufficient moisture is available. The flowering period which commences in October (or even earlier) can extend to March as seen in the highly favourable season in 2013. Plants on the site regressed markedly because of weed invasions and the trajectory for plants on the site was clearly the loss of individuals. In the absence of weed management the implications are that the population would be eliminated over an estimated time frame of between five and 10 years. These projections are evidenced by the presumed extinction of plants in road reserves (e.g. Gulf Road) which were to be monitored as ‘controls’ for the plant-out site (according to the monitoring agreement). The Hunts Lane (north and south) populations of *D. amoena* x *D. admixta* and *D. amoena* respectively are headed for extinction in the absence of weed management (Plates 5, 6 and 7).

When effective weed management on the pipeline easement was implemented in 2013 (in accordance with the Melbourne Water Weed Management Plan) there was a dramatic response in growth and (this spring) in flowering *D. amoena* plants. The species is surprisingly resilient, partly it is assumed because of the tuberous root system with stored nutrients, allowing rapid opportunistic response given favourable conditions.

*Dianella amoena* cannot persist at the plant-out site, the North-South Pipeline easement without weed management.

## 5 Recommendations

The following recommendations are made and they repeat those from the preceding two reports:

- Implement management of identified weed species (Table 1) – either control or elimination from the site. This is to be carried out by a licensed weed contractor or bushland regenerator (as per SPA-REP-GL-ENV-001-Rev D- Version01 and Melbourne Water (n.d.)).
- Ensure that weed populations on the pipeline easement outside the receptor site are regularly controlled by slashing (to prevent seeding in the major grass-weed *Paspalum* (\**Paspalum dilatatum*) or herbicide as appropriate (as per SPA-REP-GL-ENV-001- Rev D-Version01 Version01 and Melbourne Water (n.d.)).
- Ensure regular evaluation of and implementation of management on the receptor site. This may include removal of indigenous species that would adversely compete with *Dianella amoena* plants. It will also be necessary to ensure that environmental controls remain functional (i.e. gate and fencing).
- Monitor the performance of the *Dianella* plants according to the established agreement and commitment between the Pipeline Alliance, Department of Sustainability and Environment and Department of Environment, Water, Heritage and the Arts, as per reference SPA-REP-GL-ENV-001-Rev D-Version01, and the recommended amended frequency of monitoring (by G. Carr in a letter to DEWHA), that is once yearly rather than four times each year.

**Appendix 5 Plant species recorded at *Dianella amoena* Matted Flax-lily sites, Melba Highway north and south of Hunts Lane, Steels Creek, 11 January 2011 and 13 January 2012.**

An asterisk (\*) denotes exotic species.

(M - weed species that need to be managed to protect *Dianella* populations.)

Scientific Name	Common Name
<i>Acacia melanoxylon</i>	Blackwood
* <i>Agrostis capillaris</i> M	Brown-top Bent
* <i>Anthoxanthum odoratum</i> M	Sweet Vernal-grass
* <i>Arctotheca calendula</i>	Cape Weed
<i>Austrostipa rufa</i> subsp. <i>rufa</i>	Veined Spear-grass
* <i>Bromus catharticus</i> M	Prairie Grass
<i>Carex inversa</i>	Knob Sedge
* <i>Centaurium erythraea</i>	Common Centaury
* <i>Conyza sumatrensis</i>	Tall Fleabane
* <i>Cynodon dactylon</i> var. <i>dactylon</i> M	Couch
* <i>Dactylis glomerata</i> M	Cocksfoot
<i>Dianella admixta</i>	Black-anther Flax-lily
<i>Dianella amoena</i> x <i>D. admixta</i>	Hybrid Flax-lily
<i>Dianella amoena</i>	Matted Flax-lily
* <i>Ehrharta erecta</i> var. <i>erecta</i> M	Panic Veldt-grass
* <i>Eragrostis</i> sp.	Love Grass
<i>Eucalyptus radiata</i> subsp. <i>radiata</i>	Narrow-leaf Peppermint
<i>Gahnia radula</i>	Thatch Saw-sedge
* <i>Gamochaeta purpurea</i> s.s.	Spiked Cudweed
<i>Gonocarpus tetragynus</i>	Common Raspwort
* <i>Holcus lanatus</i> M	Yorkshire Fog
* <i>Hypochaeris radicata</i> M	Flatweed
<i>Leptospermum continentale</i>	Prickly Tea-tree
<i>Lomandra filiformis</i>	Wattle Mat-rush
<i>Microlaena stipoides</i> var. <i>stipoides</i>	Weeping Grass
<i>Muellerina eucalyptoides</i>	Creeping Mistletoe
* <i>Oxalis articulata</i> M	Sourgrass

Scientific Name	Common Name
<i>Oxalis exilis</i> M	Shady Wood-sorrel
